

Problem Report:

Main Problems:

- Buggy on Firefox:
- Firefox is not stable; we have tried fixing it only for it to break on other versions of Firefox. So, for the most stability, please use Chrome. If you must use FireFox, we advise using the latest version.

Internet Explorer:

- As FireFox, Internet Explorer is riddled with bugs and we can only recommend to use the latest version or Chrome.

Testing on the URL (tabdec.com):

- It is hosted on the smallest instance so there may be some lag if at certain time in the day.
- Some URLs are not correctly checked, they are added into the database even if they don't exist in the world wide web.

Coding error:

- The z-index of the website can be a little buggy at times. This mean that sometimes that when the boxes overlap other boxes it sometimes don't know which one is on top. (this happens a lot in the early stages but I found that it rarely happens now.
- The resizing of the static boxes does not currently save to the database
- When there are boxes showing and the user reduces the browse size, the boxes will disappear.
